Early Intensive Behavioral Intervention (EIBI) provides children under 6 years old with 15-30 hours of one-to-one therapy each week. While behavioral interventions have been proven to work with all ages, research tells us that early intervention increases the likelihood that a child will make dramatic gains in social and communication skills. The EIBI model combines discrete trial training, naturalistic teaching, direct instruction, and parent training, which is customized for the family and the child’s skill level.

SERVICE GOAL: To provide the skills necessary to transition successfully to daycare, preschool, or kindergarten.
